PROBLEM–SOLUTION FIT CANVAS

Project: Global Fuel Prices and Taxation Trends (2020–2026) | **Prepared for:** Anushka Dubey

1. CUSTOMER SEGMENT(S)

• Students and academic researchers studying economics, energy markets and data analytics.
• Analysts and business learners comparing fuel-price movements across countries.
• General users seeking an accessible overview of global fuel-price patterns.

6. CUSTOMER CONSTRAINTS

• Fuel-price data is spread across different sources and formats.
• Differences in currencies, units, dates and fuel categories make comparisons difficult.
• Users may have limited time or technical skills to analyse raw datasets.
• This academic dashboard uses estimated/simulated data, not verified live quotations.

5. AVAILABLE SOLUTIONS

• Government and energy-agency reports.
• Country-specific fuel-price websites and market reports.
• Spreadsheet-based comparisons and static charts.
• Data portals provide information, but users may still need to combine and interpret it.

2. JOBS-TO-BE-DONE / PROBLEMS

• Compare petrol, diesel and LPG prices across countries and regions.
• Track changes over time and identify notable trends.
• Explore estimated tax shares and subsidies across markets.
• Turn a large dataset into clear, understandable visual insights.

9. PROBLEM ROOT CAUSE

• Data is fragmented across locations, time periods and fuel categories.
• Taxation and subsidy structures differ between countries.
• Raw tables do not make patterns or comparisons immediately visible.
• Users need consistent measures, filters and visual summaries.

7. BEHAVIOUR

• Users search multiple reports or websites, then compare figures manually.
• They may rely on isolated country-level charts or broad summaries.
• With an interactive dashboard, users can filter by year, region and fuel type and inspect comparisons directly.

3. TRIGGERS

• A class assignment, research task or presentation on fuel prices.
• A sudden change in fuel prices or interest in regional differences.
• A need to compare taxation, subsidies or fuel categories across countries.

10. YOUR SOLUTION

An interactive Tableau dashboard consolidating quarterly global fuel-price records for 84 countries across 7 regions (2020–2026). It presents nine views covering fuel-price trends, regional and country comparisons, tax analysis and subsidy relationships, supported by KPI cards and filters for year, region and fuel type. It makes dataset-based patterns easier to explore and communicate.

8. CHANNELS OF BEHAVIOUR

Online: Tableau dashboard/workbook, project presentation, exported PDF or screenshots, and project documentation.

Offline: Classroom demonstration, faculty review, peer discussion and viva/Q&A.;

4. Emotions – Before / After: Before: users may feel confused or overwhelmed by scattered data and complex comparisons. After: users can feel more informed and confident because trends and comparisons are presented in a clear, interactive format.
